تحية طيبة وبعد،

أرجو معاليكم/عطوفتكم/سعادتكم التكرم بالعلم بأن أسلوب العمل الفني المتبع في وضع المواصفات القياسية والقواعد الفنية الأردنية يقتضي تعميم مشروع التصويت على الجهات ذات العلاقة، وذلك لإبداء الرأي والتصويت عليه تمهيداً لعرضه على مجلس الإدارة لاعتماده كمواصفة قياسية أو قاعدة فنية أردنية.

عطو**فة** سعادة

لذا أرجو أن أرفق لكم طياً نسخة عن مشروع التصويت للمواصفة القياسية الأردنية ٢٠٢٥/٢٤٢٢ الخاص بزيوت التزييت _ الزيوت الهيدروليكية _ المواصفات الخاصة بالفئات HH, HL, HM, HV, HG, HMHP, HVHP، الذي أعدته اللجنة الفنية الدائمة لزيوت التزييت (٤).

يرجى التكرم بعرض هذا المشروع على المختصين لديكم وموافاتنا بردكم عليه خلال شهرين من تاريخه، وذلك باستخدام بطاقة التصويت المرفقة، علماً بأن عدم الرد خلال المدة يعتبر موافقة من قبلكم على المشروع المذكور.

وتفضلوا بقبول فائق الاحترام

المديـــرالعــــام عيربركات الزهير

These Jordanian Standard 2422, JS 2421, JS 2423 and JS 2424 cancels and replaces the Jordanian Standard 476 issued in 2003.

Foreword

Jordan Standards and Metrology Organization is the national standardization body in Jordan. The work of preparing Jordanian Standards is normally carried out by technical committees composed of the interested parties, which are involved in the scope of the standard. All the interested parties have the right to comment on the draft Jordanian Standard during the inquiry stage, taking into consideration the importance of harmonizing Jordanian Standards with the international, regional or national standards (as much as possible) for the purpose of eliminating technical barriers to trade and facilitating the international trade.

Jordanian Standards are drafted in accordance with the rules given in the Jordanian Directive 1-2:2005, part 2: Rules for the structure and drafting of Jordanian Standards related to standards related to standards department.

The permanent technical committee Lubricating oils 4 has studied the Jordanian Standard 476:2003 related to "Mineral oils — Hydraulic oils", and the prepared project 2422:2025 related to "Lubricating oils — Hydraulic oils — Specifications for categories 1817, HL, HM, HV, HG, HMHP, HVHP", and has recommended to approve the amended project as a technical regulation 2422:2025, according to article (12) of Standards and Metrology Law No. (22) for the year 2000 and it's amendments.

* under amendment.

•- Introduction

Fluids for hydraulic systems are used in a wide variety of hydraulic pumps, motors and circuits. Hydraulic fluids are selected depending upon the anti-wear requirements of the equipment and the operating temperature range (temperature at cold starting and running temperature in stabilized conditions) to ensure the optimum mechanical and volumetric yield of the circuit and to protect pumps and motors against wear.

and fe are polyment of the property of the pro Mineral hydraulic fluids are formulated with mineral base stocks, from either groups I, II or III and various additives to provide the necessary oxidation stability, wear, rust, corrosion and foaming protection properties. To improve the operating temperature range, viscosity modifier polyment are

i

Lubricating oils – Hydraulic oils – Specifications for categories HH, HL, HM, HV, HG, HMHP, HVHP

1- Scope

This Jordanian Standard specifies the minimum requirements for new mineral oil hydraulic fluids and is intended for hydraulic systems, particularly for hydrostatic hydraulic fluid power application and high-performance systems. The purpose of this Jordanian Standard is to guide suppliers and end users of mineral oil hydraulic fluids and to direct equipment manufacturers of hydraulic systems.

This Jordanian Standard is intended to be used in conjunction with JS 2421, which classifies fluids used in hydraulic applications. Among the categories covered by JS 2421, only seven types of mineral oil-based fluids are covered in this Jordanian Standard. These categories are HH, HL, HM, HM, HMHP, HVHP.

2- Normative references

The following referenced documents are indispensable for the application of this focument. For dated references, only the edition cited applies. For undated references, the latest addition of the referenced document (including any amendments) applies. Indexes for published standard can be found in JSMO's library.

3- Terms and definitions

For the purposes of this Joyanian Standard, the terms and definitions given in ISO 5598 apply. ISO and IEC maintain terminology databases for use in standardization at the following addresses:

- ISO Online browsing platform: available at https://www.iso.org/obp/ui.
- IEC Electropedia available at https://www.electropedia.org/.

4- Sampling

Sampling of hydraulic oils for the purpose of this Jordanian Standard, unless otherwise specified, shall be carried out in accordance with the pertinent procedure described in ASTM D4057. The sample shall be evaluated on a representative portion. Any drum, barrel, tanker compartment or any type of container delivered to the end user may be sampled and analysed at the discretion of the purchaser.

5- Specifications

5-1 General

Most of the test methods used in the specifications in Tables 1 to 7 contain a precision statement. In cases of dispute, the procedure described in ISO 4259-2 shall apply.

5-2 Specifications for hydraulic oils, categories HH, HL, HM, HV, HG, HMHP, HVHP 5-2-1 General

For the purpose of this Jordanian Standard, oils shall be refined petroleum oils. The classification of these hydraulic oils shall be in accordance with JS 2421.

Oils, when tested under prescribed methods, shall be in accordance with limiting values set out in Tables 1 to 7.

The appearance of the delivered oils shall be clear and bright and free of any visible particulate matter, under normal visible light at ambient temperature.

5-2-2 Specifications of HH hydraulic oils

These oils are based upon mineral base oils of either groups I, II or III, or blends thereof. They is not normally contain any additive. These oils shall be in accordance with the detailed specifications given in Table 1.

5-2-3 Specifications of HL hydraulic oils

These oils are based upon mineral base oils of either groups I, II or III, or blends thereof. These base oils are supplemented with anti-corrosion, anti-rust, anti-oxidants, pour point depressants and foam inhibitors. These oils shall be in accordance with the detailed specifications given in Table 2.

5-2-4 Specifications of HM hydraulic oils

These oils are of HL type, with supplementary anti-wear/extreme pressure additives to provide the necessary wear protection properties for the hydraulic equipment. Numerous technologies of antiwear additives are available, e.g. zinc di-thiophosphate, combinations of phosphorus and sulfur-based additives. Additionally, filterability is required to protect the most sensitive hydraulic circuits. These oils shall be in accordance with the detailed specifications given in Table 3.

5-2-5 Specifications of HV hydraulic oils

These oils are of HM type, with supplementary viscosity modifiers to improve and enlarge their operating temperature range. These oils shall be in accordance with the detailed specifications given in Table 4.

5-2-6 Specifications of HG hydraulic and slift ways oils

These oils are of HM type, with friction prodifiers to enable smooth motion on the slide-ways and to eliminate the stick-slip phenomenon. These oils shall be in accordance with the detailed specifications given in Table 5.

5-2-7 Specifications of HMHP hydraulic oils

A refined mineral base oil or synthetic base stock with rust and oxidation inhibitors plus anti-wear characteristics meeting a higher performance level than an HM fluid to address higher demanding hydraulic systems (Class LIMHP). These oils shall be in accordance with the detailed specifications given in Table 6.

5-2-8 Specifications of HVHP hydraulic oils

A refined mineral base oil with rust or synthetic base stock and oxidation inhibitors, anti-wear characteristics, and increased viscosity index higher than 140 meeting a higher performance level than an HV Ruid to address higher demanding hydraulic systems (Class HVHP). These oils shall be in accordance with the detailed specifications given in Table 7.

6-Packaging

Hydraulic oils shall be packed in suitable containers that neither affect nor are affected by the oils.

7- Labeling

Each container shall bear the following information, clearly and indelibly marked, in Arabic for locally produced products and in Arabic and/or English for imported products:

7-1 Product name.

7-2 Classification of the hydraulic oil.

- 7-3 ISO-viscosity grade.
- 7-4 The word "Recycled" for oils refined after use.
- 7-5 Country of origin or the country of packaging.
- 7-6 The name and address of the manufacturer, the packer, and the trademark, if applicable.
- 7-7 Net volume in liters.
- 7-8 The date of production and /or batch number.

Note 1: IRHD international rubber pardness degrees.

Note 2: VG viscosity grade.

a) ASTM D7042 may be used with bias correction for formulated oils. ASTM D445 is the referee method.

b) For the purpose of identification, dye may be used by agreement between the supplier and the end user.

c) The requirements of the cleanliness of the hydraulic fluid is system dependent. Cleanliness level expressed according to ISO 4406 may be established by agreement between the supplier and the end user. It should be noted that the fluid is exposed to various influences during transport and storage – the cleanliness level required for the system should be guaranteed by careful filtering of the hydraulic fluid when filling.

d) For deterged hydraulic oils, the limit is increased up to 500 mg/kg.

e) ASTM 36749 or ASTM D7346 may be used provided that ASTM D97 is the reference test method to resolve doubts or dispute.

f) ASTM D664 is the referee method.

g) This property does not apply to fluid containing high detergent additive content (detergent hydraulic oil).

h) ASTM D665, soak time is 24 h.
